

**INFORME FINAL DEL
PROYECTO DE INVESTIGACIÓN DE
COLECCIONES Y FONDOS MUSEOGRÁFICOS
ADMINISTRADOS POR EL MINISTERIO DE CULTURA**

**Proyecto de la Base de Datos de Khipus – Colecciones
del Museo Nacional de Arqueología, Antropología e
Historia del Perú**

DIRECTORA:
Aql. Rosa María Varillas Palacios (RNA # BV-1729)

Lima, marzo de 2018

1. Resumen

El presente proyecto se enmarca en el Proyecto de la Base de Datos de Khipu (“Khipu Database Project”), que se inició el otoño de 2002 con la meta de colecciónar toda la información conocida sobre los khipus en un depósito central, puesto que tener los datos en forma digital permite a los investigadores hacer preguntas sobre los khipus que, hasta este momento, ha sido muy difícil contestar. El “Khipu Database Project” (KDB) es una iniciativa respaldada por la *National Science Foundation* y la Universidad de Harvard y, en esta oportunidad, busca integrar a la base de datos los khipus de la colección textil del Museo Nacional de Arqueología, Antropología e Historia del Perú (MNAHP).

2. Antecedentes, problemática, fines y objetivos de la investigación

Los bienes investigados se encuentran en el Museo Nacional de Arqueología, Antropología e Historia del Perú (MNAHP) en la colección textil del mismo.

La colección de khipus almacenada en el MNAHP está constituida por 132 bienes de distinta procedencia. Mientras que un regular porcentaje de las piezas tiene procedencia desconocida, fueron adquiridas por el museo como consecuencia de decomisos o repatriación, la mayor proporción de estas piezas fueron entregadas como parte de las Colecciones del Museo Arqueológico Víctor Larco Herrera de Arqueología Peruana en 1924. Otro grupo significativo de los khipus en cuestión forman parte de los hallazgos de las exploraciones arqueológicas del Dr. Tello llevadas a cabo entre 1913 y 1919, y en 1932. Algunos ejemplares proceden de las excavaciones arqueológicas en Monte de Cacatilla, Valle de Nazca, en Rinconada de Ate, en Paredones de Nasca, en el cementerio Armatambo y del PIA Castillo de Huarmey realizadas en el año 2013. Otros ejemplares proceden de las colecciones Honorato Amado Alferrano y San Marcos.

El fin de este proyecto fue analizar los 132 bienes (fragmentados y completos) clasificados como Khipus utilizando la metodología del Proyecto de Base de Datos de Khipus (*Khipu Database Project*) y agregarlos a la Base de Datos de Khipus de la Universidad de Harvard.

La principal pregunta de investigación que guía este trabajo es ¿Cuál fue la función de los khipus en la administración Inca y de qué maneras fue utilizado en la codificación de información? Otras de las preguntas de la investigación son: ¿Qué indicadores nos pueden permitir acceder a la información codificada en un khipu? ¿Qué tipo de mediciones y qué estándar fueron implementadas por la administración inca?

La hipótesis que maneja el proyecto es que los khipus fueron herramientas que codificaron información acerca de distintos tipos de mediciones que podrían haber sido registradas mediante su uso, especialmente datos numéricos en sistema decimal, utilizadas por la administración inca local y estatal.

Ante la necesidad de llevar a cabo un registro sistemático integral, pormenorizado de los khipus que permita su estudio libre de la manipulación de los artefactos y el libre acceso por la comunidad arqueológica, la Universidad de Harvard, a través de la iniciativa del especialista en khipus Gary Urton, desarrolló el Proyecto de Base de Datos de Khipus (KBD en sus siglas en inglés), el cual ha analizado e incorporado ya a su servidor a decenas de khipus de distinta procedencia.

El KBD y su base de datos asociada fueron diseñados e implementados específicamente para este proyecto. El esquema para introducir datos se forma según la estructura física de un khipu. La estructura completa de un khipu es como una red ramificada en la cual el número de niveles ramificados es muy variable, pero en la que los componentes de todos niveles comparten ciertas características. El esquema de datos para el KDB incluye los siguientes hechos esenciales sobre la construcción del khipu: las relaciones interconectadas entre los componentes del khipu, la estructura ramificada o arbolada del khipu, la semejanza de ciertos componentes, y las variables multidimensionales de los khipu.

Los componentes del khipu se especifican en detalle en un registro propio y son relacionados con su lugar correspondiente en base a relaciones y pautas cuidadosamente diseñadas. De esta manera, la base de datos construye una red o trama de correspondencias entre las partes del khipu. Esta base permite imitar la estructura física de un khipu sin perder precisión. Cabe señalar que el diseño actual permite libertad total en reflejar la estructura del khipu. El número de colgantes que pertenecen a una cuerda principal o los nudos de una colgante son infinitamente variables. Del mismo modo, la base de datos puede acomodarse a cualquier número de niveles de subsidiarias.

Mediante la creación de tablas que incorporan estos elementos en común para todas las cuerdas o nudos en todos niveles, aumentamos la eficiencia de nuestra estructura de datos sin impedir, al mismo tiempo, su extensión. Por último, algunas variables en sí mismas pueden tener muchas dimensiones: el color es el ejemplo más obvio. Una cuerda puede estar compuesta de varios colores distintos, e incluso puede cambiar de color a lo largo de su longitud. La base de datos contiene esta información de manera efectiva y precisa, permitiendo muchos registros de colores para una sola cuerda. En cuanto nuevas variables sean conocidas y registradas, la base de datos se extenderá fácilmente y podrá contener información completamente nueva sin comprometer los datos existentes.

3. Plan de investigación

05 de julio de 2017: Selección del material y acondicionamiento del espacio de trabajo.

06-23 de julio de 2017: Análisis de los khipus de la colección

Marzo de 2018: Entrega del informe final del proyecto

Cada día por las mañanas se llevará a cabo el proceso de extendido de los khipus y el registro fotográfico. Por las tardes se llevará a cabo la descripción y análisis de las piezas.

4. Plan de Conservación

No aplica puesto que los Khipus permanecer en MNAAHP

5. Metodología aplicada en el desarrollo de la investigación

Los Khipus son una serie de hilos y nudos hechos con fibras de algodón o de lana de camélidos. Los colores que pueden tener son el resultado de la coloración natural de las fibras, o de tintes de origen natural. La mayoría de khipus existentes son de algodón. El algodón era cosechado en varios colores naturales incluso blanco, marrón claro y verde. Se usaba todos estos colores y fibras teñidas para

lograr una gama de colores. Los khipu de algodón también pueden incluir cordeles confeccionados de lana de llama o alpaca, las que se denominan como fibras de camélidos. La cuerda principal es un componente esencial de cada khipu; es el elemento del cual todas las otras partes están atadas. La mayoría de las cuerdas principales son hilado y torcido, aunque hay unos ejemplos de cuerdas principales que son trenzado o envuelto. Típicamente, la cuerda principal es más gruesa que las cuerdas colgantes. Las cuerdas primarias varían en longitud desde 10 cm hasta 514 cm. Cuando están completos, las cuerdas primarias tienen un extremo doble—el resultado de doblar por la mitad un grupo de cordeles durante el proceso de trenzado—y el otro extremo anudado. Ambos extremos también pueden estar anudados o deshilachados, o pueden incluir manojo de tela u otros elementos especiales atados.

Las colgantes cuelgan de la cuerda principal y suelen estar dispuestas en distintos grupos, aunque a veces también se encuentran separadas por espacios de varios centímetros. Estos grupos se separan por espacios claros o se marcan con un cambio en el color de los colgantes. Cualquier cuerda colgante puede tener cuerdas adicionales colgantes que llamadas subsidiarias. Las colgantes fijadas a la cuerda primaria en la dirección opuesta a la mayoría de las otras colgantes se llaman “cordeles superiores.” En algunas colgantes los dos extremos están atados a la cuerda principal. Se llaman “colgantes lazadas.”

Para realizar el análisis, se extienden los Khipus sobre una superficie blanda de tela fina. Luego de ello se reconocen las partes ya descritas anteriormente: se comienza por la cuerda principal (a veces puede haber dos, por lo que se codifica cada una por separado), cuya longitud total extendida es medida, ya sea desde su inicio y final reales o de lo que queda de ellos, además de estimar su grosor. Luego de esto se estima el color de los hilos utilizando la tabla de codificación de colores establecida por Ascher y Ascher (ver en la bibliografía). Desde el inicio de la cuerda principal se comienzan a contar las cuerdas secundarias, medir a qué altura de la cuerda principal se encuentra cada una, cómo están atadas (*attachment*) a la cuerda principal -tipo de nudo- y su torsión en Z o S (*spin*). Finalmente, se registra la información numérica decodificada mediante el análisis de las cuerdas secundarias y los nudos.

Codificación

El código de cada pieza es consignado según la terminología del Proyecto de la Base de Datos de Khipu con las iniciales UR, con excepción de la colección de Pachacamac, que fue analizada por el ingeniero Hugo Pereyra, por lo que las iniciales son HP. En el caso de la colección previamente analizada por los Ascher, sus iniciales (AS) han sido reemplazadas por las del proyecto (UR), seguidos de un “1” y la numeración original. La numeración de las piezas es correlativa y a cada colección se le ha asignado un intervalo de números.

6. Equipo de trabajo y responsabilidades

Gary Urton: Co-Director, especialista en Khipus, llevará a cabo el análisis

Rosa María Varillas: Co-Director, asistente de análisis

Julio Saldaña Campos: asistente de análisis

7. Resultados de la investigación

Cuando se tuvo acceso al material y a la base de datos de Khipus del MNAAHP, se descubrió que un gran porcentaje de los Khipus ya habían sido analizados previamente por el arqueólogo Alejandro Rojas quien había usado desde ya las tablas y el sistema de notación del Khipu Database Project. Esta información ya se encontraba disponible para los investigadores del MNAAHP por lo cual se procedió a solo analizar los 14 quipus que no habían sido analizados previamente.

A continuación, se incluirá la tabla de resultados detallando los datos de todos los Khipus analizados. Estas tablas contienen todas las características a ser identificadas de acuerdo a lo visto en la sección de metodología y son las tablas estándar usadas por el Khipu Database Project.

8. Conclusiones y recomendaciones

Los datos recogidos mediante el estudio de los khipus en la colección del Museo Nacional de Arqueología, Etnología e Historia, en Pueblo Libre, serán una adición valiosa a la ya gran cantidad de información actualmente almacenada electrónicamente en la base de datos Harvard Khipu Database (KDB). Mientras que una de las muestras estudiadas en el Museo Nacional es de Nazca (UR281), el resto del khipus tiene procedencia de Armatambo, uno de los tres principales centros administrativos incas en el Valle del Rímac. Armatambo fue un importante centro de almacenamiento y administración incas para los valles de Rímac y Lurín; como tal, será importante estudiar los datos de estos khipus en relación con los de otros centros incas, especialmente del sitio recientemente excavado de Inkawasi, en el valle del río Cañete, donde se excavaron grandes colecciones de alrededor de 57 khipus.

Basándose en el estudio preliminar de las muestras de Armatambo, parece que los métodos de registro de datos fueron muy diferentes de los empleados en Inkawasi. Esta diferencia puede deberse a los distintos métodos de codificación / anotación utilizados por los contadores / administradores en los dos sitios, o puede deberse a diferencias en los materiales o elementos contabilizados en los dos sitios. Si bien sabemos que la mayoría de los khipus de Inkawasi contabilizaban los productos agrícolas almacenados, no contamos con evidencia definitiva de las excavaciones en Armatambo para saber qué elementos se podrían haber contabilizado con estos khipus. Se espera que el estudio de estas nuevas muestras (de Armatambo) a partir de los datos almacenados en el KDB nos brinde nuevos conocimientos sobre cómo se organizó la contabilidad khipu en este centro administrativo tan importante para la región Rimac-Lurín, el centro administrativo de Armatambo.

A medida que avance el análisis de estos khipus, será importante coordinar el estudio con el arqueólogo principal que excavó el material de Armatambo, la Lic. Luisa Diaz. Urton ha estado en contacto con Díaz y ha habido un acuerdo general entre los dos arqueólogos para colaborar en el análisis de la colección khipu de Armatambo ubicada en Pueblo Libre.

No tenemos recomendaciones específicas para hacer en la actualidad con respecto a la preservación y / o gestión de los khipus estudiados en Pueblo Libre. El personal de allí es altamente capaz y confiamos en que los khipus se conserven a las más altas expectativas.

9. Inventario de bienes culturales muebles investigados de acuerdo al formato proporcionado por el Ministerio de Cultura

10. Plan de difusión de la investigación que contenga las publicaciones científicas, presentaciones en eventos académicos, presencia en los medios de comunicación, divulgación a la comunidad, entre otros, realizado o por realiza

En primer lugar, se entregó una copia de toda la información obtenida al MNAAHP con el fin de poder compartir la información obtenida. Dicha información también será puesta a disposición del público en general de manera gratuita vía la web del Khipu Database Project (<http://khipukamayuq.fas.harvard.edu/index.html>). Esto permitirá una amplia difusión a nivel tanto nacional como internacional.

Así mismo, los resultados de nuestra investigación serán presentados en distintos foros tanto nacionales como internacionales, incluyendo la Reunión Anual de la Sociedad de Arqueología Americana. Del mismo modo, buscaremos publicar los resultados de nuestra investigación en revistas científicas tanto en español como inglés, como Latin American Antiquity, el Boletín de Arqueología PUCP, entre otros.
